

Stripe Payment Setup

Subject: Stripe payment setup — keys needed

Hi [Client name],

We are ready to connect payments to the site. Stripe will handle all card processing securely, and payouts will go directly to your bank account.

Please note: the Stripe account needs to be created and owned by you, not by us. That keeps the funds, the bank details and the tax records in your name from day one. Stripe does not allow an account to be transferred to a different owner later — it has to be recreated from scratch, which would mean losing all customer and billing history. It is worth setting this up correctly at the start.

Here is what we need from you. There are three steps.

Step 1 · Create the Stripe account

Go to <https://dashboard.stripe.com/register> and sign up using your business email address.

You will be asked for:

- Business name and address
- Business type (corporation or sole proprietorship)
- Business number, or GST/HST number
- A bank account for receiving payouts
- A piece of photo ID for identity verification

Stripe then verifies the business, which usually takes **1 to 3 business days**. It is worth starting this early so it is not holding anything up later.

Step 2A · Send us the two API keys

Once the account is verified:

- 1 Check that the **Sandbox** or **Test mode** banner is **not** showing at the top — we need the live keys, not the test ones
- 2 At the bottom left of the dashboard, click **Developers**
- 3 Open the **API keys** tab
- 4 Copy the **Publishable key** — it begins with **pk_live_**
- 5 Next to the **Secret key**, click **Reveal**, then copy it — it begins with **sk_live_**

Each key is a single long line of characters. Please copy the whole thing, with nothing added or trimmed.

Step 2B · Create the webhook and send us its secret

This one has to be created before it can be copied. It is what lets the site know when a payment has succeeded.

- 1 Still under **Developers**, open the **Webhooks** tab
- 2 Click **Add endpoint**
- 3 For the endpoint URL, paste exactly the address below

```
https://api.canadianmdjobs.com/api/v1/subscriptions/webhook/
```

Then select these five events, and no others:

```
checkout.session.completed  
customer.subscription.updated  
customer.subscription.deleted  
invoice.payment_succeeded  
invoice.payment_failed
```

Click **Create**. On the page that follows, find **Signing secret**, reveal it, and copy it — it begins with **whsec_**.

Step 3 · Send the values securely

The **secret key** gives complete access to your Stripe account, including the ability to move money. Please do **not** send it by ordinary email or chat, where it stays readable in the message history.

Use one of these instead:

- **https://onetimesecret.com** — paste the values there and send us the link. It self-destructs once opened, so it cannot be read twice.
- The secure-sharing feature of a password manager, if you already use one.

One question before we finish: should prices be charged in **CAD** or **USD**? Since the business is Canadian, CAD is usually the better choice — it avoids currency conversion fees on every payout. Just let us know which you prefer.

If Step 2B looks confusing, just send us screenshots of what you are seeing and we will guide you through it.

Best regards,
[Your name]
